

Reclaiming water is essential but with responsible disposal of the resulting waste by enhancing nature.

SPIRAL JET TELFON NOZZLES

These nozzles are our preferred nozzle for evaporation of any waste, the Teflon finish is less likely to have scaling issues and withstands up to 200psi pressures and extreme PH better than the alternatives

We utilize a ¼" spiral jet, our preferred supplier is Bete but we may substitute TeeJet to meet inventory demands

Pictured below is close up of our spiral jet nozzle

The size of the hole in the nozzle has been matched to the size of the stainless steel screen on the self cleaning filter when we supply pumping. This results in eliminating plugging issues, if the waste goes thru the intake filter it will go thru the nozzle, KISS principle at work.
